

74HC244

Octal 3-State Noninverting Buffer/Line Driver/ Line Receiver

High-Performance Silicon-Gate CMOS

The 74HC244 is identical in pinout to the LS244. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This octal noninverting buffer/line driver/line receiver is designed to be used with 3-state memory address drivers, clock drivers, and other bus-oriented systems. The device has noninverting outputs and two active-low output enables.

The HC244 is similar in function to the HC240A.

Features

- Output Drive Capability: 15 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: 1.0 μ A
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7A
- ESD Performance: HBM > 2000 V; Machine Model > 200 V
- Chip Complexity: 136 FETs or 34 Equivalent Gates
- This is a Pb-Free Device

P _D	Power Dissipation in Still Air, TSSOP Package†	450	mW
T _{stg}	Storage Temperature	- 65 to + 150	°C
T _L	Lead Temperature, 1 mm from Case for 10 Seconds (TSSOP Package)	260	°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND ≤ (V_{in} or V_{out}) ≤ V_{CC}.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

†Derating — TSSOP Package: - 6.1 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2 of the ON Semiconductor High-Speed CMOS Data Book (DL129/D).

The diagram illustrates a 3-to-8 decoder circuit. It features three inputs: DATA INPUT A OR B, ENABLE A OR ENABLE B, and a third input line labeled 'TO THREE OTHER A OR B INVERTERS'. The circuit is enclosed in a dashed box labeled 'ONE OF 8 INVERTERS'. Inside, the DATA INPUT A OR B is inverted and then ANDed with the output of the 'TO THREE OTHER A OR B INVERTERS' line. The ENABLE A OR ENABLE B input is also inverted and then ANDed with the output of the 'TO THREE OTHER A OR B INVERTERS' line. The output of the first AND gate is connected to the base of an NPN transistor, which is also connected to V_{CC}. The output of the second AND gate is connected to the base of a PNP transistor, which is also connected to V_{CC}. The emitter of the NPN transistor is connected to ground, and the emitter of the PNP transistor is connected to ground. The collector of the NPN transistor is connected to the output line Y_A OR Y_B. The collector of the PNP transistor is connected to the output line Y_A OR Y_B.
