

MC10123

Triple 4-3-3-Input Bus Driver

The MC10123 consists of three NOR gates designed for bus driving applications on card or between cards. Output low logic levels are specified with $V_{OL} = -2.1$ Vdc so that the bus may be terminated to -2.0 Vdc. The gate output, when low, appears as a high impedance to the bus, because the output emitter-followers of the MC10123 are "turned-off." This eliminates discontinuities in the characteristic impedance of the bus.

The V_{OH} level is specified when driving a 25-ohm load terminated to -2.0 Vdc, the equivalent of a 50-ohm bus terminated at both ends. Although 25 ohms is the lowest characteristic impedance that can be driven by the MC10123, higher impedance values may be used with this part. A typical 50-ohm bus is shown in Figure 1.

- $P_D = 310$ mW typ/pkg (No Load)
- $t_{pd} = 3.0$ ns typ
- $t_r, t_f = 2.5$ ns typ (20%–80%)

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.
